

WHAT IS CLAIMED IS:

1. A traffic monitoring system comprising: a plurality
of active monitors each tapping a physical line on a network
and analyzing traffic; and a manager collecting analysis
5 results from said active monitors, respectively, wherein

said manager comprises:

means for loading a management application program for
managing the respective active monitors to the manager
itself;

10 means for executing said management application
program;

means for delivering a traffic analysis program to each
of said active monitors; and

15 means for communicating with said active monitors,
each of said active monitors comprises:

means for loading the traffic analysis program
delivered from said manager to the active monitor itself;

means for executing said traffic analysis program; and

means for communicating with said manager, and wherein

20 each of said active monitors provides a traffic analysis
result to said manager through said communication means in
response to a request from said manager.

25 2. A traffic monitoring system according to claim 1,
wherein

said manager further comprises means for unloading said management application program.

5 3. A traffic monitoring system according to claim 1, wherein

each of said active monitors further comprises means for unloading said traffic analysis program in response to a request from said manager.

10

4. A traffic monitoring method comprising: a plurality of active monitors each tapping a physical line on a network and analyzing traffic; and a manager collecting analysis results from said active monitors, respectively, the method comprising the steps of:

allowing said manager to load and execute a management application program;

allowing said manager to request said active monitors to load a traffic analysis program;

allowing said active monitors to load and execute the traffic analysis program in response to said load request;

allowing said manager to request the active monitors to collect analysis results; and

25 allowing said active monitors to provide the analysis results to the manager in response to said request,

respectively.

5 5. A traffic monitoring method according to claim 4,
further comprising the steps of:

allowing said manager to request said active monitor
to unload said traffic analysis program; and

allowing said active monitors to unload the traffic
analysis program in response to said unload request.

10

6. A traffic monitoring method according to claim 5,
further comprising a step of allowing said manager to unload
the management application program from the manager itself.

15

7. A traffic monitoring system according to claim 4,
wherein

20 said manager holds topology information concerned
about the respective active monitors on a network, and
manages traffic based on the analysis results collected from
said respective active monitors and said topology
information.

25

8. A traffic monitoring system according to claim 4,

further comprising a step of changing operation parameters for the traffic analysis program, the traffic analysis program now being executed by each of the active monitors.

5

9. A traffic monitoring system according to claim 4, wherein

each of said active monitors identifies a packet and a protocol under control of said traffic analysis program.
